

Architecture Contribution Confirmation

IMPORTANT: This document is artificially generated for testing the VisaPilot evidence-reconciliation workflow. It is **not** an authentic employer, journal, conference, government, or third-party record and must not be presented as real evidence.

Evidence source type: Synthetic employer-style technical record

Claim selected for testing

“Distributed Configuration Drift Detection Platform” — designed in 2019; an internal platform comparing configuration state across distributed enterprise systems.

Document content

For this synthetic test scenario, Arjun Mehta is described as the principal architect for a configuration-drift detection platform developed during an enterprise cloud modernization initiative.

The platform was designed to compare configuration state across distributed enterprise systems and identify material configuration drift for engineering teams.

The architecture work included service design, event processing, configuration-state comparison, alerting, and integration with existing enterprise infrastructure.

The document attributes the architecture work specifically to Arjun Mehta. It does not independently establish the legal significance of the contribution or any USCIS outcome.

Test metadata

Candidate	Arjun Mehta
Test relation	Supports contribution + attribution
Potential criterion	C5
Status	Synthetic

Expected VisaPilot test behavior: this document should be treated as supporting material only after the system parses it, associates it with relevant claims, and reconciles the relationship. The synthetic label should remain visible to the human tester.
